Survey: Despite Slow Adoption, Companies Are Putting Artificial Intelligence on Fast Track

A new global study finds that while the use of artificial intelligence (AI) is low today, it is expected to create increased revenues, productivity, profitability and shareholder value for businesses within two years.

Overall, only 16 percent of business leaders surveyed perceive they are gaining significant value from advanced AI, according to the report, "Competing in the Cognitive Age: How companies will transform their businesses and drive value through advanced AI" by global consulting firm Frost & Sullivan. However, AI programs are being fast-tracked and that number is expected to more than triple to 52 percent within the next two years.
